Contactless Visitor and Employee Management from Aware

Touchless access. Workplace confidence.

Contactless Sign-In

Aware's facial and voice recognition is entirely touchless, increasing visitor and employee safety by removing the need for touching shared devices and logbooks. Users can present their faces and voices without the touch of a button.

Robust Security Measures

Be confident knowing who is visiting the office. Aware's liveness detection provides advanced presentation attack detection algorithms for both face and voice, detecting not only victim impersonation, but also identity concealment. Liveness is also entirely passive, ensuring the user experience is not impacted negatively.

Frictionless User Experience

Get visitors and employees where they want to go quickly and easily. Aware's password-free facial and voice biometric recognition allows for convenient, frictionless onboarding and authentication, reducing waiting time and improving social distancing.

Existing System Integration

Aware's mobile biometric frameworks can be integrated directly into an existing visitor management system, providing market-leading biometric functionality without the need for a full system replacement and costly hardware upgrades.
